

## **Beautiful life thanks to spinal implants**

Spinal pain is part of everyday life for many people.

Thanks to modern surgical procedures, it is possible to free many sufferers from their back problems.

For the applied surgical procedures so-called spine implants are used. Surgeons usually use a system that combines screws, cross links, hooks and rods. [These implants](#) are needed to correct misalignments and ultimately stabilize the spine. Spine implants are used in chronic degenerative disc disease and traumatic fracture, and in spinal instability such as scoliosis.

Such implants are made of high quality titanium. These implants are offered in various sizes and shapes. There are implants for patients of all ages. For especially slim patients there are also low profiles. Spine implants enable surgeons to correct spinal deformities three-dimensionally through surgery. Also the instruments for the implantation are a very important factor for a successful surgery.

They need to be simple, safe and of high quality and flexibility to serve all needs.
